Customer Selected Exteriors

Design Homes Engineers Walk the Walk

When Design Homes builds a home for you, there is another world available to you. Design has the capabilities to build your favorite shade of GREEN, build Energy Star® compliant, and assist with the design so that everything works... form can meet function. Design Homes would like to build your next home.

When it comes to building green, Design Homes' Engineering Department not only talks the talk but also walks the walk.

Designing with green in mind is an environmentally responsible way to help lower the carbon footprint of new homes in the environment and the community. With increasing concerns within the new construction industry regarding climate change, energy usage, indoor air quality and emissions, the work of the Design Homes' Engineering Department is critical to your success in building green. Design Homes' engineers have solutions that can help lower residential energy usage, use more environmentally sustainable materials, improve air quality, and lower emissions.

Working within your customers' budget and designing with the environment in mind, Design Homes' engineers not only talk the talk but also walk the walk on building green. Design Homes can assist you in focusing on those green upgrades that will be the most cost effective for your client.

Keep in mind that local rebates and tax credits are key to reducing the product and installation costs for some energy savings systems.

The key elements of a builder's quest for a "greener" home should offer limitless design capabilities, maximum energy efficiency, resistance to extreme weather, better indoor air quality, and reduced maintenance costs.
